

FIR

Fir is universally recognized for its superior strength-to-weight ratio, and is often the first choice of Architects and Engineers looking for the best in structural timber. It is not uncommon to see it used in four and five story timber frame buildings. It is also one of the few species available in big timbers from managed renewable timberlands.

APPLICATIONS

The dimensional stability, durability, nail-holding capability, and excellent fire rating makes Fir the ideal general purpose wood for timber framing in residential, commercial, industrial and structural formwork.
